Presentation

It is with great satisfaction that we present the 2019 Scientific Report of the **Health Research Institute of the Hospital General Universitario Gregorio Marañón (liSGM)** in an exercise of dissemination of the activity carried out with the aim of, on the one hand, exposing before institutions and social agents the research and innovative capacity of the liSGM and, on the other hand, and in a particularly relevant way, to recognize the **extraordinary effort made by the researchers** of each Research Group. This year it is especially important to highlight and thank the dedication of all the members of our institution in the extraordinarily adverse and complex circumstances that have resulted from the COVID pandemic.

The important research activity developed has allowed a significant growth (close to 20% with respect to the previous year) of the scientific production of the Institute, which has meant in the year 2019 to reach **4750 points of impact factor**. It is important to highlight the extreme rigor with which the awarding of publications to the liSGM is analyzed, which clearly determines the robustness of the indicator. Additionally, of note are the significant number of publications (46%) led by liSGM researchers, the degree of international collaboration in different publications and the proportion of originals in journals of first decile and quartile (46%).

In a similar way, the **innovation activity of the liSGM** should be highlighted, which allows it to boast a portfolio of innovation assets, including a brand new «spin-off», adapted to the current needs of the health system and, above all, with great potential for future growth and highly attractive to the productive and industrial sector.

All this activity is possible thanks to the excellent capacity of the researchers to **compete effectively in competitive calls** for projects and human resources. This last aspect is especially noteworthy, since it is the basis for ensuring the generational replacement of the center's researchers. In this context, it is important to highlight the commitment of the liSGM groups with the **training of researchers**, which has resulted in a significant number of doctoral theses defended throughout 2019 and the ambitious Researcher Training Plan (with 13

accredited courses) that is being developed under the coordination of the liSGM Training Commission.

The liSGM, through its managing body, the **Foundation for Biomedical Research Hospital Gregorio Marañón (FIBHGM)**, makes a continuous effort to improve its internal **management processes** and is committed to a **continuous quality improvement**, as a result of which it has recently achieved the European seal of excellence in human resources management «**Human Resources Strategy For Researchers**» (HRS4R), as well as becoming the **first Health Research Institute to be fully certified under ISO9001:2015** in the country.

Once again, we take the opportunity offered by this platform to express our sincere thanks to all the **liSGM researchers** for their efforts in a context as sensitive as that represented by scientific research in hospitals. Only a cohesive collective effort, duly aligned with a strategy around the improvement of patient health, provides the excellent results that are collected in this report. In the same way, it is important to thank all the **Area Coordinators, Group Leaders, Research Groups, Research Support Services (RSS), Clinical Services and especially the young researchers**, who are the basis of the development and activity of the liSGM.

The situation reflected in this report shows that our Institution maintains its evolution and growth, generating excellent expectations for the future and placing it in a privileged position to face the enormous future challenges that are in sight, to ensure not only compliance with the requirements of the new **Technical Guidelines for the Evaluation of Accreditation of Health Research Institutes** of the Carlos III Institute of Health, but especially to illuminate the foundations of biomedical research: observation, which generates questions, in clinical practice followed by a multidisciplinary cooperative research to answer them.

Thank you very much.

Executive summary

Global analysis

Analysis of the scientific production of IISGM and its bibliometric impact is an essential element in the evaluation of the Institute's research activity, given that both factors reflect the competitiveness of its researchers

In order to prepare this Scientific Report, we analyzed journals indexed in the **Web of Science** and in **PubMed**, an open-access database specialized in health sciences.

It is important to note that before being assigned to the different research Areas and Groups, the only publications considered were those in which IISGM, Hospital General Universitario Gregorio Marañón, or both were included in the institutional affiliation data in Web of Science. Nevertheless, as a somewhat novel aspect of this new edition and thanks to the recent implementation of the scientific management tool Fund@net, the search for publications is made based on the name(s) that the individual researcher at the IISGM has pointed out as being his/her own.

As in previous years, the total sum for the impact factor only takes into account information from indexed publications (eg, original articles, reviews, editorials, and proceedings papers) and **excludes** other types of publication (eg, letters to the editor and case reports). Of note, the impact factor presented in the figures corresponds to the relevant year of publication

Publications involving different groups or areas of the IISGM are counted individually in each group and area, although only once for the calculation of the total impact factor.

The objective of the methodology used is none other than to apply internationally validated bibliometric tools for the analysis of scientific production, thus ensuring the robustness of the data contained in this Scientific Report.

The following graphs provide a quantitative representation of the scientific output of IISGM during the year 2019.

The graphs show strong consolidation of the growth trend observed in recent years, with a total of **956 indexed publications** (884 excluding letters), which represent a **global impact factor over 4750 points** [4210 excluding letters], that is, **an increase of 1815 points** since 2015, as well as **an increase of 725 points with respect to the previous year** and **61.8% in the last 5 years**.

Total general	2935	2984	3969	4025	4750

The previous figures summarize the total impact factor corresponding to the scientific production of the IiSGM for each of the last 5 years and its distribution according to the different types of publication.

As can be observed, in this year 2019 the highest impact factor corresponds (in order) to: original articles, review and editorials. It is important to note that, once again this year, the increase in the overall impact factor was mainly due to the increase in the number of original articles.

Scientific output of IiSGM in indexed journals with impact factor: distribution by quartiles (relative to 2019)

Scientific output of IISGM in indexed journals with impact factor: distribution of publications by deciles and quartiles (absolute values)

The distribution of IISGM publications according to quartile and decile is shown in the previous-figures. The absolute number of first-decile and first quartile publications continues to be greater than last year.

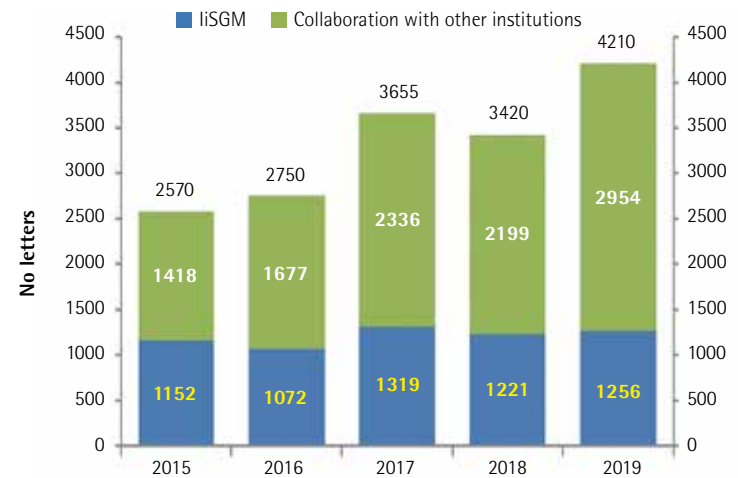

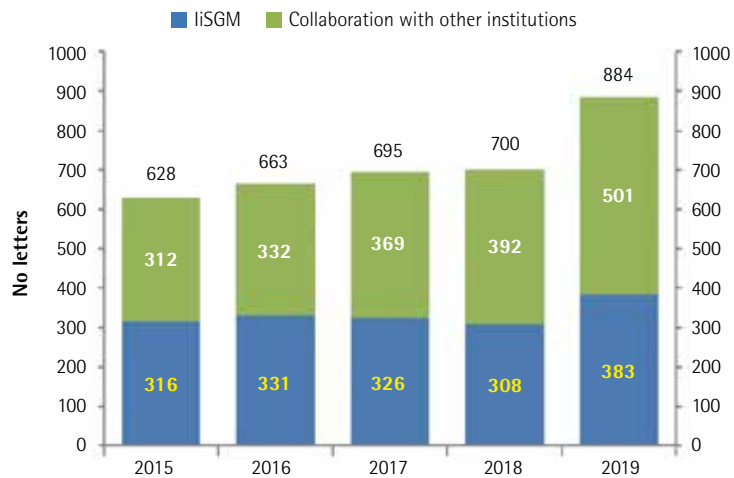

Global impact factor and mean impact factor by publication

Scientific output of IISGM in indexed journals with impact factor: total number of publications

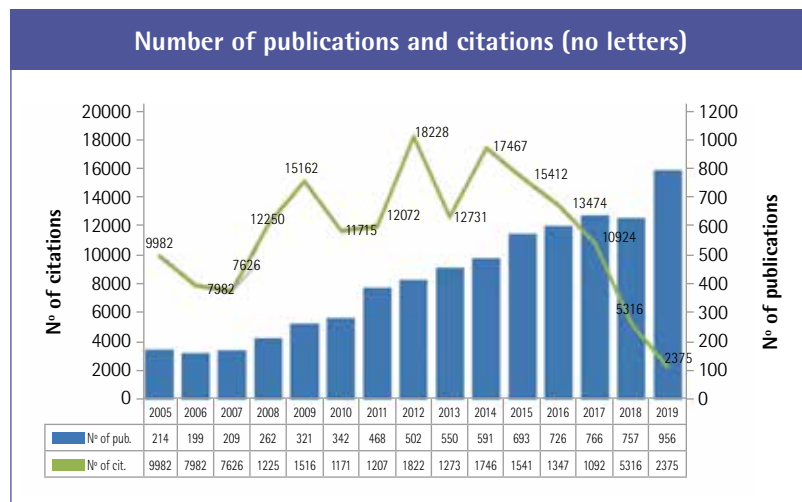

Scientific output of IISGM in indexed journals with impact factor: impact factor

The analysis of activity specifically includes publications whose principal authors (first, last, or corresponding author) are IISGM researchers.

As for collaborative scientific output:

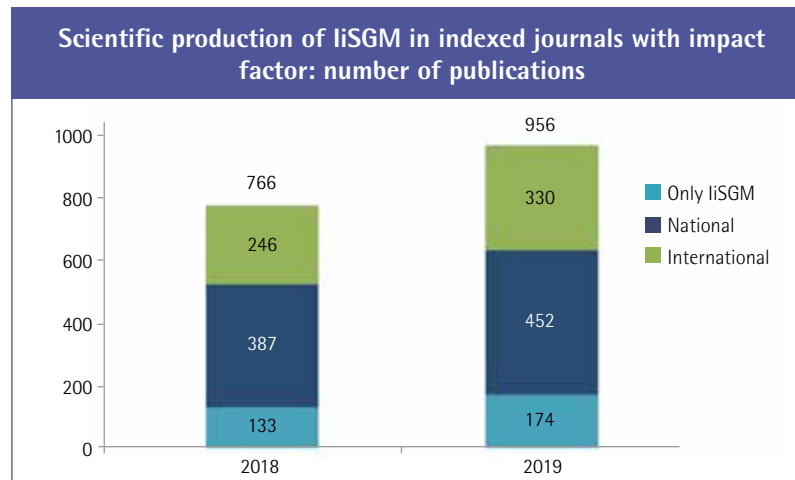

1. With letters: **54.4% of publications** and **65.8% of the impact factor** are accounted for by articles **generated in cooperation with other institutions**. Approximately **45.6% of the scientific output of IISGM** is accounted for by articles whose **main authors belong to the IISGM**.
2. Without letters: **56.7% of publications** and **70.2% of the impact factor** are accounted for by articles **generated in cooperation with other institutions**. Approximately **43.3% of the scientific output of IISGM** is accounted for by articles whose **main authors belong to the Institute**.

The number of citations for Institute publications over time is logically greater in older publications, although the number of citations is noteworthy, as is the number of first-quartile citations.

It is important to highlight the number of collaborations between the IISGM research groups with other national and international research groups and their evolution over time: **34.52% of the scientific output of the IISGM is in collaboration with other international research groups**. **47.28% with other Spanish groups** and the rest (**18.2%**) are IISGM's own publications.

Finally, one of the most relevant elements within the scientific structure of health research institutes is the grouping of research activity to priority areas, which are characterized by their scientific and social relevance and by their capacity for transferring knowledge to society.

liSGM has **seven priority research areas** and also a specific research group on Nursing Care whose scientific activity is set out in detail below in 2 figures per Research Area:

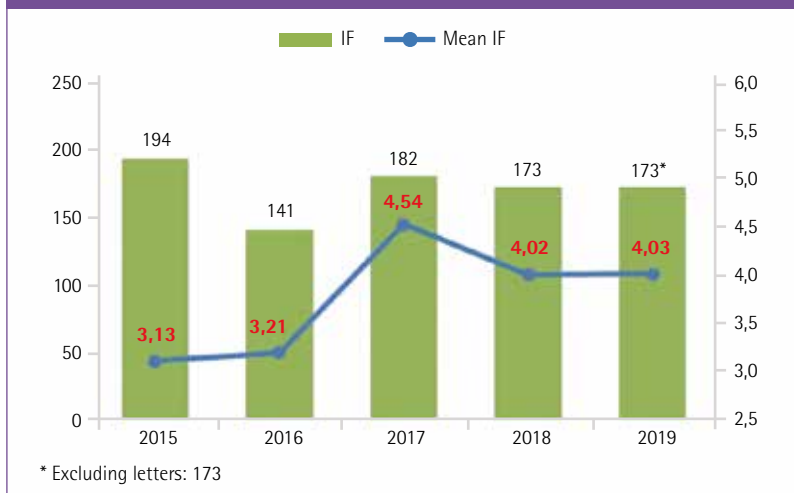

- The first (on the left) summarizes the total impact factor together with the mean impact factor by publication.
- The second (on the right) summarizes the scientific output of the research area distributed by first decile and quartiles.

Both figures show the scientific output for the last 5 years:

CARDIAC IMAGING UNIT

Rationale

Measurement of heart function is a key objective in the evaluation of the effect of cardiovascular therapy. Given their close correlation with long-term diagnosis, the scientific evidence generated during the last 50 years has consolidated the use of measures based on cardiovascular imaging techniques as surrogate objectives in clinical trials on cardiovascular medicine. In addition, the criteria for inclusion of patients in clinical trials are usually established depending on the cut-off points in various heart function indexes.

Furthermore, studies aimed at evaluating the safety of drugs used in other disciplines more frequently require evaluations of potential cardiotoxicity. Therefore, the development of biologics, mainly in the field of oncology, has led to an increase in demand for the evaluation of heart function as part of many clinical research protocols.

Given its availability, portability, and low cost, echocardiography is the initial technique of choice for assessment of heart function and monitoring of progress after a specific therapeutic measure. Nevertheless, at present, cardiac magnetic resonance provides more accurate and reproducible parameters for obtaining data on ventricular function and size. Since the variability in measurement decreases compared with other techniques, magnetic resonance has shown that it is possible to significantly reduce the sample size in studies based on measurement of ventricular function. Stratification of cardiovascular risk based only on clinical criteria has proven insufficient in a large number of patients, mainly those in the «intermediate risk» group. Moreover, pharmacologic intervention in chronic inflammation in clinical practice may have a direct effect on cardiovascular risk. In this context, the noninvasive measurement of atherosclerotic load and intima-media thickness using carotid ultrasound provides a well-validated surrogate index of cardiovascular risk in a specific patient.

On this basis, the mission of the Cardiac Imaging Unit is to provide a service to research groups both within and outside the IISGM that can benefit from evaluation of heart function with echocardiography or magnetic resonance and evaluation of the risk of atherosclerosis using carotid ultrasound.

Facilities

Echocardiography and carotid ultrasound are performed to support researchers in the Echocardiography Laboratory, which is situated on the Ground Floor of the Ambulatory Care Pavilion, HGUGM. The laboratory has 2 cutting edge machines that were acquired by the IISGM for research studies.

Magnetic resonance is performed using specific equipment purchased by IISGM and is used preferentially for cardiac magnetic resonance. The system is a Philips Achieva with a 1.5 T magnet in the magnetic resonance area situated in the basement of the Oncology Pavilion. The equipment has complete software for cardiovascular examinations and is integrated with the hospital's computer system.

The Cardiac Imaging Analysis Unit of the Cardiology Service is situated on the ground floor of the IPMQ building in Hospital Gregorio Marañón. It covers 40 m² and has a latest-generation computer system with high storage capacity. It also has validated systems for quantitative evaluation of cardiovascular parameters (see below).

Services provided

Echocardiography

Image acquisition: 2D, 3D, tissue Doppler, color Doppler, continuous wave Doppler, and pulse Doppler of heart valves in parasternal, apical, subcostal, and suprasternal planes. Images are acquired using a 2.0 to 4.0 MHz transducer and a volumetric probe in a high-end device. The definitive model can be selected depending on the needs of the researcher.

Carotid ultrasound

Acquisition of images using B mode and Doppler ultrasound of the common carotid artery, carotid sinus, and internal carotid artery with a linear probe.

Functional cardiac MRI without contrast

Acquisition of sequences to evaluate biventricular function in cine mode in short axes with complete coverage from base to apex of the LV:

2 cameras, 4 cameras, 3 cameras. 1.5 T device (Philips Achieva, software package release 9).

Functional cardiac MRI with and without contrast

After administration of a bolus of gadolinium contrast medium (0.2 mmol/kg), a multiplane perfusion sequence is run in an initial stage, followed by a 3D delayed enhancement sequence using inversion-recovery. Inversion time is adjusted using the Look-Locker tool. The images are acquired 15 minutes after administration of contrast. 1.5 T device (Philips Achieva, software package release 9).

Standard echocardiography (as per request)

Assessment of biventricular function using 2D images, assessment of mitral filling Doppler flow velocity, LV outflow tract, estimation of lung pressure, and tissue Doppler at the level of the mitral and tricuspid valves (EchoPac v.110.1.2, GE).

Advanced echocardiography (as per request)

Measurement of biventricular function using 3D images of the LV (EchoPac v.110.1.2, GE) and 3D imaging of the RV (4D-RV function; TomTec Imaging Systems). Measurement of longitudinal and circumferential strain of the LV. Measurement of 3D strain in LV (EchoPac v.110.1.2, GE).

Carotid ultrasound (as per request)

Measurement of the intima-medial thickness at the level of the common carotid artery, carotid sinus, and internal carotid artery (software IMT, EchoPac v.110.1.2, GE, software Q-Lab, Philips or ImageJ, which is adaptable according to the manufacturer).

Cardiac MR (as per request)

Biventricular function, quantification of segmental contraction («Wall Motion Analysis»), evaluation of intracardiac flow, quantification of delayed uptake (Medis® Cardiac MR QMass® and QFlow®). System can be adapted for quantification of clinical and preclinical imaging in large or small animals.

Procedure for requesting a specific service

The order form to be used is liSGM IM-SPE-7.

The order form has 5 sections:

1. Name of the ISS.
2. Name of the person requesting the service.
3. Data on the service required and budget*.
4. Remarks: Indicate whether the invoice is a self-invoice**.
5. Signatures.

NOTE: Sample transport is the responsibility of the Imaging Unit. The procedure is as follows:

- Issue the study protocol whose parameters are to be analyzed.
- Once the protocol is studied by IU staff, the custom designed CRFs are sent to the center performing the study.
- The persons performing the study send the imaging studies to be analyzed to the IU with their corresponding CRFs.
- Performance of the analysis.
- The results are sent to the center performing the study.
- Imaging studies are filed in the IU for 1 year for re-analysis or to analyze other parameters if necessary.

3D MEDICAL PRINTING UNIT

Justification

3D printing is a type of additive manufacturing that allows a digital model to be transformed into a real three-dimensional object. The objects are built layer by layer, using different technologies, such as stereolithography (SLA) or deposition of molten thermoplastic material, the latter being the most popular desktop technology in in-house 3D printing environments.

Limited for a long time to the industrial field, 3D printing has evolved to reach the professional user.

In the medical 4.0 the manufacture of biomodels and custom devices through 3D printing allows:

- Personalized medical care: patient-centered precision medicine, improved perceived quality thanks to improved medical communication, and objective quality allowing the optimization of therapeutic times.
- Education and clinical training: medical training and procedure simulation.
- Pre-clinical testing: improving device design by testing on simulation models.
- Innovation in customized medical devices: advanced rapid prototyping reducing verification and validation times.

HGUGM has pioneered the introduction of 3D printing as a working tool in clinical practice and research. In 2014, the first surgery was performed using patient-specific surgical guides manufactured on site for an intervention in Orthopedic Surgery and Traumatology. Since then, the interaction with different specialties has allowed us to gather the knowledge and experience necessary to offer a cost-effective medical 3D printing service.

Description

It is a research support service (SAI) that helps health professionals and researchers who have a need in which 3D printing can contribute to the development of a specific and individualized application in the health area.

- Afternoon/evening: 15:30 h to 21:00 h (5.5 h).

In addition to the Surgical Session, requests can be made for animals, support staff, and other equipment (see rates).

The small-animal rooms can be used for a half-session.

FLOW CYTOMETRY AND CELL SORTER UNIT

Misión

The Flow Cytometry and Sorter Unit is a Research Support Service (RRS) of the IISGM. The Unit's mission is to provide flow cytometry support to researchers, both from the IISGM and external or private companies. The Unit offers scientific-technical support to researchers ranging from experimental design advice, data interpretation, to the use of computer software for multiparametric analysis. This will allow the discovery, identification and tracking of cell markers, also facilitating the separation of different identified cell populations.

Descripción

Flow cytometry is an analytical/quantitative technique by which multiple characteristics can be measured in cells or particles of interest contained in a fluid, through marking with antibodies or fluorescent probes. The interaction with a laser will result in a scattering of light and fluorescence that will translate into obtaining detailed information on the structural and functional characteristics of the cells or particles under study. The application of the Cell Separator (Sorter) allows to separate cell populations in sterile conditions according to the characteristics analyzed by flow cytometry.

With this technique, multiple applications can be realized at the same time in a reduced sample volume. It is important to emphasize that this technique performs measurements particle by particle, beyond the descriptive population measures. The identification of cellular markers is of application in the investigation, diagnosis, follow-up and treatment of very diverse pathologies, reason why the Flow Cytometry and Cell Separation is a technology implied in the translational investigation.

The Flow Cytometry Unit has been certified since 2016 according to the guidelines of the Quality Management System (ISO 9001:2008) and since 2019 meets the requirements of the updating of the standard (ISO 9001:2015).

Facilities and technology

The core area of the Bioinformatics Unit is located on the ground floor of the Experimental Medicine and Surgery Department of IISGM.

Studies with large computational requirements—such as next-generation sequencing or advanced statistical modeling—can be performed using HP Proliant DL380 G9 servers, an HP Z820 workstation, and 2 NAS servers, as well as desktop devices and the necessary network infrastructure. These were purchased by the IISGM and the Medical Oncology Service.

These devices are housed at two locations: the desktop devices, workstation, and one of the NAS servers are in the Experimental Medicine and Surgery building; the computing servers and the other NAS server is in the Data Processing Center of Hospital General Universitario Gregorio Marañón (HGUGM).

The Bioinformatics Unit works together with the Translational Oncology Laboratory of the Medical Oncology Service, actively cooperates with the ISS of the Genomics Unit, often carries out processing of data from the NanoString and Illumina MiSeq quantification platforms.

Innovation, knowledge transfer, and translation to practice

INNOVATION SUPPORT UNIT

Innovation is a key element in the development of the research community, especially in the health care sector. IISGM's commitment to this activity is unwavering and has led to the creation of a structure aimed at providing researchers with a smooth path from the innovative idea to the development of the end product.

The objectives of the IISGM include encouraging and developing innovation within the organization by promoting the transfer of the results obtained by its professionals to society, the health system, the scientific community, and the financial system.

The Innovation Support Unit came into being from a powerful research and technological development group in the area of biomedical instrumentation and engineering at Hospital General Universitario Gregorio Marañón, with a solid record in transferring technology to the industrial sector.

The unit is structured in such a way that it provides channels for the ideas and proposals of professionals working at the hospital. Thus, the unit can support and advise researchers along the different stages of the innovation and transfer process, with the aim of turning their proposals into products and services that add value to the health system and society.

The purposes of the Innovation Support Unit include the following points:

- Providing the necessary support to professionals working at the hospital to help them innovate
- Bringing the culture of innovation and entrepreneurship closer to health/research professionals

Technology Companies / Start Up

The creation, consolidation and proliferation of companies requires a series of prerequisites to be met:

- Investment in R&D that contributes to the creation of new technological opportunities.
- Risk capital to finance the first stages of development of a start up.
- A culture favourable to entrepreneurship in the environment.
- Specific programmes to support the creation of start-ups.
- A regulatory-institutional framework that favours R&D&I, the protection of intellectual property and bringing researchers closer to the business world.

In this regard, it is worth highlighting the creation of the following companies:

AMBIOX BIOTECH, S.L.

Ambiox Biotech is characterized by its entrepreneurial spirit, capacity for innovation, and social commitment. Its mission is to apply innovative developments in nanotechnology to the field of biomedicine, thus bringing added value to Society that can be appreciated at international level. The creativity and innovation of Ambiox Biotech are developed for application in human health care, thus forging a link between science and the market.

The company was created as a spin-off at Universidad de Alcalá de Henares. Its team includes M^a Ángeles Muñoz, Director of the HIV Molecular Biology Group of the IISGM.

SIMCOSMETIC BIOTECH, S.L.

SimCosmetic Biotech develops new dermocosmetics using natural ingredients. Its biotechnology platforms are designed to combine natural ingredients in order to generate new high-quality protected dermocosmetics with synergetic activity.

The company was the fruit of a joint venture between Hospital Gregorio Marañón, Instituto Maimónides de Investigación Biomédica de Córdoba (IMIBIC), and the University of Freiburg (Germany), as well as with leading companies in the field of natural ingredients and development of cosmetics. SimCosmetic's key advantage in developing new dermocosmetic and skin care products is its ability to cooperate with various public and private organizations.

NATURE 4D

Nature 4D designs, develops, and sets up advanced imaging devices tailored to the needs of the client. These devices have multiple applications in the field of biomedicine and basic research.

Nature 4D was created as a spin-off at Universidad Carlos III de Madrid based on technology developed within the framework of the IISGM. Its activity focuses on advanced optical imaging techniques, specifically advanced microscopy and preclinical optical imaging techniques. Thanks to a software application developed and registered by the sponsor and the company's highly specialized experience, Nature 4D offers tailored solutions involving optical imaging devices with user-friendly software for the acquisition and representation of data in 2D and 3D.

CORIFY CARE, S.L.

Corify Care is a spin-off of funded by main world-wide experts on cardiac arrhythmias which is going to introduce in the market a novel medical device to non-invasively map cardiac arrhythmias in real time. This novel technology will improve the treatment in more than 10 million of atrial fibrillation patients only in Europe. Its non-invasive electroanatomical mapping system allows the possibility to map all atrial fibrillation patients even during a regular visit to the cardiologists without the need of invasive catheters.

Corify Care was created as a spin-off at IISGM de Universitat Politècnica de Valencia. Its team includes Andreu Climent (CEO), Francisco Fernández-Avilés and Felipe Atienza of Cardiovascular Diseases Area of the IISGM.

Interventional and non interventional clinical studies

During the year 2018, a total of **1115** clinical studies (clinical trials and observational studies) were active in our hospital. A total of 208 studies were implemented.

Approximately 95% of the clinical trials with medicines started during 2018 were Phase I, II, and III studies.

As for the distribution by research areas, almost 46.1% of the clinical trials were led by the Translational Oncology Area (Area 6).

Funding of IISGM

The global analysis of Institute funding was performed by collecting all income obtained by research groups both from competitive/noncompetitive projects and from clinical trials, agreements with various bodies, and donations.

The objective of this methodology is to be able to provide information on the capacity of IISGM groups to generate income.

The total income generated by IISGM researchers 'own activity in 2019 came to 16.476.182 15,503,687 € that is, 6,3 % more than in 2018.

To these revenues must be added the nominative subsidy granted to this foundation by the Consejería of Health of the Community of Madrid, which would raise total revenues to **17.098.402 euros**.

	2015	2016	2017	2018	2019
Total income generated by researchers	13,235,424 €	14,219,400 €	14,431,258 €	15,503,687 €	16,476,182 €
Nominative subsidy C. Madrid				612,220 €	622,220 €

As in previous years, this income is earmarked for the support and development of research activities in the groups.

EVOLUTION OF INCOME GENERATED BY RESEARCHERS BY CATEGORY

Overall, the distribution of income is as in previous years, with national competitive projects representing 39% and Clinical Trials 33%.

57% of income was from the private sector

Of all income generated exclusively by researchers, 58% was from the private sector, reaching the figure of 9,745,976 euros in 2019, 58% of this amount was from clinical trials activity.

43% of the resources obtained from competitive calls

Despite the reduction in funds available for research projects through competitive call, especially in the public sector, the IISGM continues to have a considerable ability to generate income from competitive calls. In fact funds generated through National Competitive calls have increase 13,4% over the last 2 years.

As in previous years, in the case of individual information provided by each group in this report, only projects obtained by groups in **competitive calls (public and private)** where the principal investigator was a group researcher are reported.

Therefore, other sources of funding have not been taken into account.

The objective of this premise is to provide information on the capacity of each of the groups to obtain funding in a competitive environment

Scientific publications

The list presented below shows all the referenced publications in which investigators from the IISGM participated in during 2019.

Publications with an impact factor greater than **10 points are highlighted**.

In order to obtain the total impact factor, only information from publications indexed as original articles, reviews, editorials, and proceedings papers have been taken into account. Other types of publication (eg, letters to the editor and case studies) have not been included.

It is important to note that publications involving different groups or areas of the Institute are computed individually in each group and area, although only once for purposes of the calculation of the Institute's total impact factor.

Training: courses, seminars, and one-day training sessions

During 2019, the IISGM Training Committee continued working along the same lines as in previous years to detect specific needs in training.

After requesting information from IISGM researchers by means of a needs analysis, we assessed the results and decided on the areas that were most relevant for the Institute.

These can be seen in the Training Plan 2018 (<http://www.iisgm.com/actualidad/convocatorias-y-formacion/>).

In general terms, the training activities offered by IISGM are certified by the Continuing Training Committee of the Health Care Professions of the Autonomous Community of Madrid.

As set out in the Training Plan, during 2019, the IISGM offered the following opportunities for training:

- Third edition of the ***Basic Course in Research Methodology***, which tries to cover the needs detected for training in basic areas of methodology in the needs analysis. This essentially practical course lasts 20 hours and is aimed mainly at medical residents and staff members who are in the early stages of their research career.
Based on a case study, the course addresses review of information sources, design of a research project and database, and basic concepts of statistical analysis, interpretation and representation of results, as well as the synthesis and reporting of the information obtained.
- Fourth edition of the ***Course in Biomedical Research Methodology***, which is organized into 4 modules lasting 80 hours. The course provides advanced training in the basics of biomedical research methodology. The format of the course enables it to cover the all areas from the initial research hypothesis to publication of results.
- Fifth edition of the ***Course on Biomedical Research Instrumental Techniques***, which aims to provide researchers with data on the main instrumental techniques and the various research platforms of the IISGM.
- Second edition of the ***Advanced Course on Surgery for Research With Rodents***, which aims to train the student in experimental surgery with laboratory animals.

The course is practical in nature and addresses various surgical and microsurgical techniques.

- First edition of the ***Course on the Basics and Application of Flow Cytometry in Biomedical Research***.
- Pilot edition: ***Practical Course in Biomedical Research for Veterinarians***. The course lasts 500 hours and is aimed specifically at graduates in veterinary medicine who have completed their studies during the 3 years before the beginning of the course. The main objective is that the student acquire knowledge and skills that are highly practical and applicable, enabling him/her to acquire a solid grounding for future integration in an experimental research team.

The IISGM has the ideal facilities, equipment, and staff for organizing training activities at the highest level. Therefore, its human and material resources can be appropriately managed to design competitive and high-quality training. The course has very specific elements that set it apart from the range of courses provided by health research institutes and could eventually become a reference in the field of postgraduate training for veterinarians.

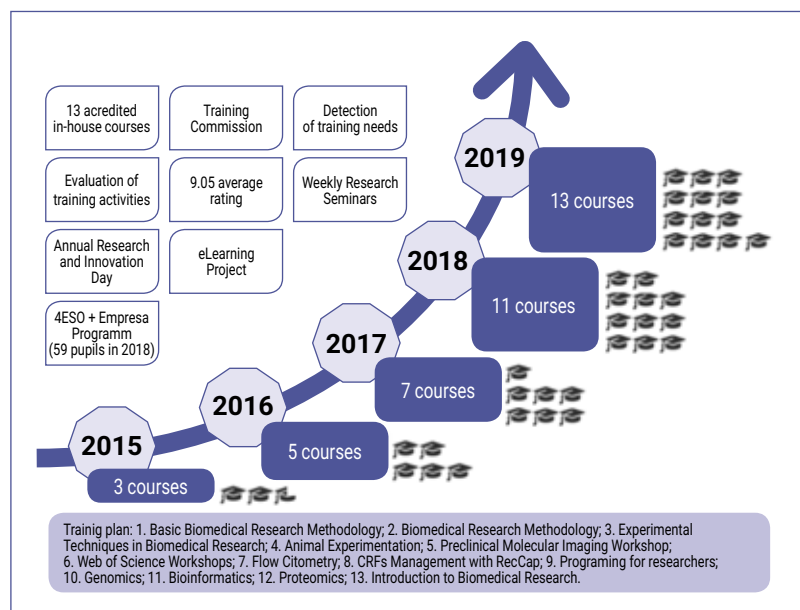

Furthermore, the ***IISGM Research Seminars Program*** is continuing, with weekly sessions covering areas of basic research (Lab Meetings), clinical medicine, and practical aspects of research, as well as with the participation of guest researchers. This forum is considered by the Institute to be the perfect space for implementing cooperation and synergies between groups from the IISGM and researchers from other institutions who are invited to speak.

Other courses provided included the following:

- Seminars on research and lectures in the Medical Imaging Laboratory of the Experimental Medicine and Surgery Unit.
- A series of training activities were coordinated from the Nursing Research Support Unit, as follows:
 - Training courses in research methodology for resident nursing interns in gynecology and obstetrics, mental health, and pediatrics. First steps in bibliographic searches and information resources in health sciences and qualitative research.
 - Workshops: bibliographic searches and reference management. Creation of databases in access.

Biomedical Engineering

The Area of Biomedical Engineering is a particularly interesting facet of the Instituto de Investigación Sanitaria Gregorio Marañón (IISGM [*Gregorio Marañón Health Research Institute*]). It provides a complementary and clearly enriching vision of the type of research traditionally carried out in biomedicine. Its emphasis on technology, transferability, and immediacy of application, together with its clear orientation towards innovation, makes it an area of considerable added value.

These characteristics are evidenced by the considerable number of joint publications with other groups and areas of the Institute. In fact, the Area of Biomedical Engineering leads the Red de Innovación en Tecnologías Médicas y Sanitarias (ITEMAS [*Medical Technology Innovation Network*]) of the Instituto de Salud Carlos III (*Carlos III Health Institute*). This area is also the link between the IISGM and Universidad Carlos III. In addition to its research activity, it plays a key role in the new undergraduate Degree in Biomedical Engineering offered by Universidad Carlos III.

Not surprisingly, therefore, the strategic axes of this area are directed towards consolidating collaboration with Universidad Carlos III (in which the incorporation of new research groups will be essential), defining and strengthening the area's role in teaching, consolidating the functioning of the Innovation Support Unit of Hospital General Universitario Gregorio Marañón (HGUGM) –which has considerably stepped up its activity during recent years– and intensifying its strategy of supporting and complementing clinical research.

Its marked technological character makes the Area of Biomedical Engineering a key player in obtaining funds from EU framework programs. Greater emphasis will be placed on this activity in the coming years.

Lastly, the Area of Biomedical Engineering aims to introduce a series of activities aimed at facilitating the participation of other technology groups in the IISGM, thus promoting multidisciplinary research capacity and rapid knowledge transfer, and, in short, responding effectively to key issues in the field of biomedicine.

Research lines

- ▶ L1: Support for clinical research.
- ▶ L2: Technological development.
- ▶ L3: Biomedical experimentation.

The work of this group is aimed mainly at research into medical imaging techniques, in terms of both developing new technology and processing methods and practical applications for clinical practice and biomedical research.

The group comprises researchers from very disparate fields (eg, physicians, engineers, physicists, and biologists) who belong to Universidad Carlos III and to Hospital Gregorio Marañón. Professionals from both entities work together to constitute the IISGM. The group's clearly multidisciplinary character creates a strong connection with real clinical and preclinical needs. Collaboration with hospitals and other biomedical research centers facilitates rapid validation of results and has generated several successful cases of technology transfer to industry.

Consequently, the group has a wide range of imaging and processing techniques, some of which were obtained before they became commercially available. These techniques enable the group to offer advanced imaging services to internal and external research groups.

Research activity is based on 3 major lines: imaging support for clinical research, development of imaging tool technology, and biomedical research projects that require preclinical molecular imaging.

The research group of computer architecture, communications and systems (ARCOS) represents the Computer Architecture and Technology Area at the Carlos III of Madrid University.

Its main objective is to investigate and develop hardware and software systems in the areas of real-time and embedded systems, high-performance computing, storage systems, dependable systems.

ARCOS is a dynamic research group that is currently conducting research in various HPC areas. Our research activities are oriented to the development of new software for large-scale parallel and distributed systems, These activities cover the development and optimization of parallel and distributed applications, real time, reliable designs, and high performance computing, including cross-

layer optimizations of HPC storage I/O stack, parallel file systems, I/O acceleration of scientific workflows, auto-tuning of parallel I/O based on machine learning, dynamic monitoring of HPC infrastructures, convergence of HPC and Bigdata software stacks, and resource allocation elasticity in HPC and clouds.

All the former knowledge has been applied to several scientific and industrial areas, such as fluid mechanics, reconstruction of 3D medical images, Big Data Analytics, finance computing, and simulations involving complex systems, trying to combine real world engineering with cutting-edge research topics. As a result, ARCOS has strong relations with a portfolio of major European laboratories and companies in areas such as Informatics, Bioengineering and Aerospace.

Moreover, ARCOS researchers are leading several European projects, such as COST Action IC1305 entitled «Network for Sustainable Ultrascale Computing» (NESUS, www.nesus.eu), with more than 70 institutions from 40 countries all around the world, or the projects REPARA (www.repara-project.eu) and RePhrase (rephrase-ict.eu) that address the programmability for parallel systems with special attention to heterogeneous architectures.

Besides that, ARCOS is actively involved in the standardization of the C++ programming language (representing Spain in the ISO C++ standards committee).

Biomedical Engineering

Cardiovascular diseases constitute a major health problem in developed countries, both because of their prevalence and incidence and because of their severity; hence the importance of a research area for cardiovascular diseases in the IISGM. The Area of Cardiovascular Diseases covers all aspects of this modern epidemic, through basic research and, very importantly, clinical research, including various emerging and associated clinical groups from a variety of hospital services.

A particularly interesting characteristic of this Area is its cooperative spirit. Its main group coordinates the national Red de Investigación Cardiovascular (RIC [*Cooperative Network for Research on Cardiovascular Disease*]) for the study of cardiovascular diseases, which is funded by the Instituto de Salud Carlos III. Of particular interest, this area includes basic research groups belonging to the Universidad Complutense and envisages wide-ranging agreements with American universities for the development of an ambitious program for the generation of artificial organs (SABIO Project). In addition to such important ongoing projects, the Area of Cardiovascular Diseases has forged an ambitious set of objectives for the coming years, including promotion of basic research laboratories, increased funding from the EU's Seventh Framework Programme for Research and Technological Development, and development of a model for the evaluation and identification of intellectual property products.

Finally, the Area of Cardiovascular Diseases places particular emphasis on undergraduate education and, importantly, training for research personnel.

The group is composed of three professors (Dr. Delpón, Dr. Tamargo, and Dr. Caballero) from the Department of Pharmacology of the School of Medicine of UCM and has formed part of the IISGM since its inception date. It is also integrated by a Postdoctoral Researcher of the Talent Attraction Program of the Community of Madrid (Dr. Cebrián) and six predoctoral hired.

The group maintains its uninterrupted activity for more than 30 years in the areas of cardiac cell electrophysiology and cardiovascular pharmacology. Our group is the founder and coordinator of the ITACA consortium (www.itaca.edu.es) dedicated to translational research in hereditary cardiac arrhythmias.

At present, the research lines funded by competitive national and regional projects are:

AREA 3

Area coordinator:
Celso Arango López

Neuroscience and Mental Health

One of the main research lines in the area of neuroscience is the study of the etiology and pathogenesis of neurodevelopmental disorders, such as autism spectrum disorders, schizophrenia, and other psychotic disorders.

The psychiatry group of this area participates and collaborates in national and international multicenter projects associated with environmental and genetic risk factors, functional and structural imaging studies, and intermediate mechanisms such as the search for endophenotypes and the biological bases of neuropsychology.

The relevance of the work carried out resides in the group's ability to perform longitudinal studies of unusual types of patient, such as those with early-onset first psychotic episodes or children and adolescents at risk of severe psychiatric disease. Research to date has been multidisciplinary and translational and oriented toward resolving findings associated with the clinical activity of these diseases. In fact, currently established clinical programs for these diseases are being investigated and benefiting from close coordination between clinical practice and research. One of the main associated research lines concerns developmental neuropsychopharmacology, which includes projects on pharmacogenetics and pharmacovigilance, as well as phase II/III clinical trials financed using competitive public funds and private funds.

Finally, a further 2 lines of interest for this group are research on the empirical evaluation of psychotherapeutic approaches during early-onset first psychotic episodes and research into quality of services and evaluation of programs. The success of the group has been particularly apparent in recent European calls for projects and its coordination of the Centro de Investigación Biomédica en Red de Salud Mental (CIBERSAM [Networked Center for Biomedical Research in Mental Health]). Furthermore, activity in neuroscience and mental health has been increasing in several emerging groups in fields such as neuroimmunology and movement disorders.

The group «Neurobiological and psychological underpinnings of mental disorders. Neurodevelopmental disorders», led by Dr. Celso Arango, has developed a prolific research activity in collaboration with national and international groups during recent years. This group is one of the few to gain international recognition in the field of childhood and adolescent onset schizophrenia and early onset psychosis, as well as in neuropsychopharmacology in neurodevelopmental disorders. The quality of its scientific output is reflected by the number of projects with external evaluation that have been funded by competitive calls of public and private institutions (e.g., Instituto de Salud Carlos III, Ministerio de Educación, BBR Foundation, Fundación Mutua Madrileña, Fundación Alicia Koplowitz), predoctoral and postdoctoral researchers with contracts funded by public competitive funds, publications, and collaborations, including development of several novel research lines in collaboration with other departments at the Hospital and IISGM (e.g., biochemistry, medical imaging, experimental medicine, cardiology, genetics, and nutrition, among others). The research team also has broad experience in training in research through a systematic training plan with regular quality checks as part of the EFQM quality assurance program implemented in the Department of Child and Adolescent Psychiatry, Institute of Psychiatry and Mental Health, which has achieved a «+500» classification in the EFQM programme. Several members of the group participate or have participated in 10 projects funded by the European Union Seventh Framework Programme, including one project funded «Network of European Funding for Neuroscience Research (ERANET-NEURON)», 3 projects funded by the Innovative Medicines Call of Horizon 2020 and a project funded by the United States National Institute of Mental Health (NIMH). The group has published numerous articles in high-impact journals (e.g., Nature, Nature Genetics, PNAS, American Journal of Psychiatry, JAMA, Lancet Psychiatry, British Journal of Psychiatry, Schizophrenia Bulletin, Journal of the American Academy of Child and Adolescent Psychiatry, etc.) in the fields of schizophrenia, autism spectrum disorders, and other neurodevelopmental disorders. Their scientific activity has also been translated to clinical practice through several clinical trials and the development and publication of clinical practice guidelines for the management of children and adolescents with neurodevelopmental disorders and other conditions such as psychosis, bipolar disorder, and autism spectrum disorder.

AREA 4

Patricia Muñoz García de Paredes

Clinical Microbiology, Infectious Diseases and AIDS

Despite considerable advances in our knowledge of infectious diseases in recent years, infection continues to be the main health problem facing society today. The spectrum of infection has been modified by the appearance of new infectious diseases, the increase in the number of immunosuppressed patients with their corresponding opportunistic infections, resistance to antibiotics, and the increased frequency of severe fungal infections. Hence the need for a priority research area in infectious diseases and AIDS at the IISGM. Essentially, this area carries out its research around 2 consolidated groups that generate considerable activity both in clinical practice and in laboratory research. In particular, the groups of the area form part of the Centro de Investigación Biomédica Enfermedades Respiratorias (CIBERES [*Networked Center for Biomedical Research in Respiratory Disease*]), promote and lead cooperative networks in transplantation (RESITRA), and manage different multicenter cohorts in the field of AIDS (GESIDA [*AIDS Study Group*]).

The fact that the area runs several research lines covering the broad spectrum of infectious diseases has not prevented it from generating considerable scientific and academic output during the last 5 years. Of note, a strength of this area is its ability to obtain human resources through competitive calls.

Undoubtedly, the future of this area is based on the maintenance of those aspects of translational research that have characterized its activity to date. Basic research laboratory work has increased, and new molecular epidemiology systems based on direct sample analysis have been implemented. The area has also promoted cooperative epidemiological studies aimed at analyzing aspects such as the extent of antifungal resistance or at optimizing the treatment of infectious complications in transplant recipients.

In summary, the Area of Infectious Diseases and AIDS maintains the commitment to research that has marked its history. This commitment is based on the conviction that no medical activity of excellence can be envisaged without a structured approach to the most pressing issues affecting daily clinical practice.

The group is coordinated by Prof. Emilio Bouza and Dr. Patricia Muñoz and is part of the Department of Clinical Microbiology and Infectious Diseases of Hospital G.U. Gregorio Marañón, which came into being in 1984.

The group has broad experience in the training of research staff in a multidisciplinary group including biologists, physicians, and pharmacists who are constantly involved in the diagnosis, prevention, and treatment of infectious diseases.

The group is home to both research staff and health professionals managing highly complex patients, in particular, immunodepressed patients with nosocomial diseases, thus enriching training capacity and ensuring the link with day-to-day patient care and the identification of translational problems.

The group's scientific output has made it one of the world's leading research groups.

Diseases of the Immune System

Immunology could be considered the medical discipline in which the most relevant advances have been made in recent years. These advances are evidenced by the many Nobel Prizes awarded to researchers in the field. It is no surprise, therefore, that the IISGM has a dedicated immunology research area. In addition to its scientific and social relevance, the importance of this area within the Institute can be seen in its cutting-edge scientific output, the wide variety of its research lines, and its collaborations with other research areas, such as basic and clinical immunology, rheumatology, allergology, gynecology and obstetrics, cardiology, pneumology, pharmacogenetics, hematology, and neurology.

The participation of this Area in numerous publications by groups belonging to other areas of the Institute clearly highlights its philosophy of cooperative research, the cornerstone of any health research institute. There can be no doubt that the Area is perfectly situated for setting down the strategic lines for its continued growth. As a result, collaboration agreements have been proposed with prestigious international institutions, groups from the IISGM itself, and groups from outside the IISGM (Madrid Science and Technology Park, FHL Study Group, Transfusion Center of Comunidad de Madrid), School of Medicine of Universidad Complutense de Madrid (Department of Microbiology I), and companies active in the field (Binding Site, Izasa, Inmunotek, Grifols).

The area has set itself the strategic objectives of expanding the core activity of its more clinical groups, training undergraduate and postgraduate staff in order to consolidate and improve scientific output, and expanding the number of principal investigators able to successfully apply for competitive calls.

The professionals of the Rheumatology Service of the HGUGM have great experience and dedication especially in systemic autoimmune diseases and chronic arthritis of adults and children, as well as in the management of biological therapies and new small molecules. The Rheumatology service at the HGUGM has a broad portfolio of services, a high-quality Day Hospital, a Musculoskeletal Ultrasound Unit, Microscopy and Capillaroscopy, a Biological Therapy Unit, a Child Rheumatology Unit and a specialized fertility consultation in rheumatologic patients, who work with high coordination to improve patient care and enhance biomedical research activity. The teaching activity complements the care and research activity, with 8 Rheumatology residents in training, undergraduate students of the medical school and national and international external rotants who come to improve their training and skills in clinical management and techniques used in daily practice.

The Immuno-regulation Laboratory (LIR) led by Rafael Correa Rocha constitutes an emerging group within the Gregorio Marañón Health Research Institute (IISGM), included in Area 5 (Pathology of the Immune System). The group has focused its research on the study of the immunological mechanisms involved in different immune pathologies of pediatric patients. These studies constitute an unpublished line in the center and have resulted in the development of a pioneering clinical trial in the world to prevent rejection in children transplanted from the heart through a therapy with Treg cells. Another principal investigator of the group, Dr. Marjorie Pion, is developing a leading line of research on the genetic modification of immune cells for the development of advanced cellular immunotherapies.

In addition, we are very aware of the training in the field of pediatric infectology of junior researchers who are joining, where they play an important role in research and many of them end up carrying out translational research activity and culminating in doctoral thesis.

It highlights networking and collaborations with other national and international research groups. In addition, the group has a cooperation commitment by training professionals from Africa and Latin America, who support their clinical and translational research activity in person and through telemedicine and other information techniques.

Traslational oncology

The general research objective in the Area of Oncology in the liSGM is to generate reliable and scientifically relevant data on the personalized treatment of cancer. This objective is met through high-quality translational research that enables the selection of the antitumor treatment with the most options for cure, the least toxicity, and the fewest adverse effects.

Therapy is based on the patient's genetic/molecular profile (pharmacogenetics) and on the tumor profile (pharmacogenomics). Appropriate selection of patients with cancer for the sophisticated antitumor therapy available at our center (targeted medical therapy, high-definition radiotherapy, cell therapy, hematopoietic stem cell transplant) ensures the ideal choice for each patient. The work carried out in the Area also includes the study of hereditary/familial cancer syndromes and other situations with a high risk of cancer in which various interventions are effective for reducing the probability of the disease occurring.

Group director: **MIGUEL MARTÍN JIMÉNEZ**

Organisms involved: **HGUGM**

Type: **Consolidated Group**

The generic objective of research in the Oncology Area is to generate reliable and scientifically relevant information on the individualized treatment of cancer, through translational research, which can allow the selection of antitumor treatment that provides more curative options and less sequelae to each patient. The therapy selection will be essentially based on the genetic / molecular profile of the patient and the tumor. The appropriate selection of cancer patients candidates for sophisticated antitumor therapies (target medical treatments, high definition radiotherapy, cell therapy, hemopoietic progenitor transplantation) available at our center, will allow the most suitable choice for each patient. In addition, the Area will study heir-familial cancer syndromes and other situations of high risk of cancer occurrence, in which various interventions can be very effective in reducing the likelihood of disease occurrence.

AREA 7

Area coordinator:
Rafael Bañares Cañizares

Systemic Diseases and Organ Transplantation

The Area of Systemic Diseases comprises a broad spectrum of mainly clinical research groups. Its most fruitful research lines range from acute and chronic kidney failure to the biology of aging, covering fields such as the pathophysiology of liver and digestive diseases and abdominal organ transplantation. In addition, some of the groups in the Area participate in cooperative research structures funded by the ISCIII, such as the Centro de Investigación Biomédica en Red: Enfermedades Hepáticas y Digestivas (CIBEREHD [*Networked Center for Biomedical Research in Liver and Digestive Diseases*]) and have made a relevant contribution to the development and implementation of clinical practice guidelines or participate in and lead international cooperative academic projects, especially in South America. Similarly, some groups in the Area support European technology projects investigating home application of diagnostic tools and treatment for elderly patients.

The Area of Systemic Diseases is clearly heterogeneous, although several specific axes of activity can be defined.

The first is the clear increase in scientific output and its quality, with preference for emerging groups. The second involves promotion of translational research, by bringing research support platforms and services to clinical groups. Rapid solutions to research problems can only be found through a gradual process of addressing clinical issues in the laboratory. In the third axis, appropriate support and advice enable scaled application of researchers and groups for competitive funding calls, with the aim not only of obtaining financial support but also of addressing evaluations in an enriching competitive environment. Lastly, the Area aims to develop objectives in undergraduate and postgraduate training with the implementation of predoctoral programs in the various groups.

Chronic kidney disease (CKD) is a major public health problem. A systematic review, based on population studies from developed countries, described an average prevalence of 7.2% (individuals over 30 years old).

According to data from the EPIRCE study, it affects approximately 10% of the Spanish adult population and more than 20% of those over 60 years of age, and furthermore, it is probably under-diagnosed. In patients followed in Primary Care with diseases as frequent as high blood pressure (HTA) or diabetes mellitus (DM), the prevalence of CKD can reach 35-40%. The magnitude of the problem is even greater considering the increase in morbimortality, especially cardiovascular, related to renal deterioration.

Developing a good level of prevention should be a priority objective at the level of national health systems to avoid this dramatic increase in CKD and its consequences. Our research group aims to contribute to improve the prevention, diagnosis and complications of acute and chronic renal failure with different and wide lines of research in all fields.

Since 2017 we are part of RedinRen as a research group. The Renal Research Network (REDINREN) is a Thematic Network of Cooperative Research (RETIC) funded by the Carlos III Institute of Health Research belonging to the Ministry of Health, Consumer Affairs and Social Welfare, which aims to shorten the distance between research, clinical care and citizens and is a reference in the field of nephrology. REDINREN represents the cooperation of the most outstanding basic, translational and clinical research groups in Spain committed to the health of patients with renal disease (www.redinren.org). We are also a member of the Consortium for Research on Acute Renal Failure of the Community of Madrid (CIFRA2-CM) whose objectives include development of new models of acute renal failure in which to study the development of new models of early diagnostic tools, prognostic biomarkers and new therapeutic approaches (<http://www.cifra2-cm.com/>)

7.02. Pathophysiology and natural history of liver and digestive diseases

Group director: **RAFAEL BAÑARES CAÑIZARES**

Organisms involved: **HGUGM**

Type: **Consolidated Group**

Research lines

- ▶ L1: Complications of cirrhosis: natural history of liver cirrhosis.
- ▶ L2: Regulatory mechanisms of the permeability of the intestinal barrier and effect on intestinal homeostasis and on the pathogenesis of inflammatory bowel disease.
- ▶ L3: Liver transplant in the 21st century.
- ▶ L4: Role of intercellular communication through exosomes in liver diseases.

This is a translational, multidisciplinary research group with clinical and basic research lines aimed globally at understanding the natural history and physiopathology of liver and digestive diseases.

Specifically, the research lines focus, in the case of liver diseases in cirrhosis and its complications, especially those derived from portal hypertension, artificial liver support, liver transplantation and liver cancer. In the field of gastroenterology,

the group focuses on inflammatory bowel disease and the study of intestinal permeability and its regulatory mechanisms.

The group includes several principal investigators with overlapping funding in competitive public and private calls, and also carries out a considerable number of phase II-III clinical trials. Among the latest projects, it is worth mentioning the inclusion of the first patients in a project H2020 (ALIVER Project) aimed at the clinical assessment of a new artificial liver support device.

The group also acts as the coordinating group for the EXOHEP-CM program, aimed at studying cellular communication by exosomes and other extracellular vesicles, granted for the creation of networks between Research Groups in Technology and Biomedicine of the Community of Madrid, and as the group responsible for the NanoLiver-CM program aimed at the application of nanotechnology and biomedical imaging in liver disease granted in the call for synergetic R&D projects of the Community of Madrid, both co-financed with FEDER and European Social Fund funds.

The group is part of the CIBER of hepatic and digestive diseases since its inception.

It also stands out for its marked teaching vocation, both undergraduate and graduate.

The Diseases of the Critically Ill Child research group of IISGM is formed by a team of pediatricians who care for and treat critically ill children.

The group develops experimental, academic, and clinical research lines with projects that bring together translational animal experimentation, clinical research, and application of the results in teaching.

The basic research lines are cardiorespiratory arrest and cardiopulmonary resuscitation, invasive and noninvasive hemodynamic monitoring, nutrition in the critically ill child, kidney failure, continuous renal replacement therapy, and monitoring of analgesia and sedation in critically ill children.

The group's basic objective is to collaborate with other pediatric groups and groups from specialized areas to perform multicenter studies.

The Pediatric Intensive Care research group of HGUGM is a member of the only pediatric research network funded by the Instituto Carlos III—Red de Salud Maternoinfantil y del Desarrollo (Red Samid [*Mother and Child and Developmental Health Network*])—and coordinates the Red Iberoamericana de estudio de la parada cardiorrespiratoria en la infancia (RIBEPCI [*Latin American Network for the Study of Cardiorespiratory Arrest in Infancy*]).

It is a multidisciplinary group that includes anesthesiologists, thoracic surgeons, basic researchers and pulmonologists. Their different lines of research include the biology, physiopathology of the lung, airway and respiratory muscles as well as the effect of lung diseases on aerobic capacity and peripheral muscles. The group also has a vocation to develop and participate in clinical studies aimed at lung diseases and the prevention and management of perioratory complications.

7.18. Peritransplant evaluation of the liver

Group director: **JOSÉ MARÍA PÉREZ PEÑA**

Organisms involved: **HGUGM**

Type: **Associated Group**

Research lines

- ▶ L1: Evaluation of early function of the liver graft. Leaders: Dr. Luis Olmedilla Arnal and Dr. José M^a Pérez Peña.
- ▶ L2: Usefulness of cardiac biomarkers and cardiac hemodynamic monitoring in cirrhotic patients during liver transplant. Leader: Jose M^a Pérez Peña.
- ▶ L3: Influence of anesthetic agents during major liver surgery. Leader: Dr. Luis Olmedilla Arnal

The members of the research group are part of the Anesthesiology and Recovery Department of Hospital Gregorio Marañón. Their care activity is aimed at the field of anesthesia and postoperative recovery in major abdominal surgery. Since 1990, when we started the liver transplant (LT) program in HGU Gregorio Marañón, we have formed part of the anesthesia team responsible for LT and have developed various research lines in this field and in major liver surgery in close collaboration with the Hepatology and Surgery Services. During the last few years, we have been developing the following research lines:

1. Methods for the rapid diagnosis of early graft failure in LT. One of the challenges of LT is that of early diagnosis of graft failure in order to review potential factors involved (especially arterial thrombosis, which can be addressed using surgery) in order to treat them before they become irreversible. One of the methods proposed is indocyanine green clearance, which involves elimination of a dye from vascular circulation exclusively via hepatic uptake and biliary clearance. Our group has developed a research line on the predictive ability of hepatic clearance of indocyanine green in liver graft failure, morbidity and mortality, and early lesions of the biliary tract after LT.
2. Use of cardiac biomarkers and cardiac hemodynamic monitoring in cirrhotic patients undergoing LT. Our group had previously studied the preoperative

evaluation of cardiomyopathy in cirrhotic patients and its influence on intraoperative behavior during LT. We are currently investigating the utility of cardiac biomarkers (troponin and proBNP) and intraoperative monitoring of cardiac and pulmonary hemodynamic parameters during LT with respect to perioperative morbidity and mortality after transplant.

3. Influence of anesthetic agents in major liver surgery and LT. The various anesthetics induce variations in hepatic blood flow, systemic and portal hemodynamics, and modulation of the inflammatory response during liver surgery and LT. Our group is using an experimental porcine model to evaluate the effects of the anesthetics used in clinical practice (sevoflurane and propofol) on liver hemodynamics and function after extensive resection.
4. Our group forms part of a multidisciplinary clinical and experimental research team composed of hepatologists, surgeons, pathologists, biochemists, and anesthesiologists from HGU Gregorio Marañón. In recent years, the team has been developing a research line in a porcine experimental model of the pathophysiological mechanisms that affect in the development of acute liver failure after extensive resection and «small for size» syndrome, as well as the effects of normothermic perfusion on marginal donor liver graft recovery and liver regeneration.

Our group develops its research activity in the clinical field with a clear vocation for translational research. The group is currently made up of three main clinical researchers (Vidán, Ortiz, Serra) capable of successfully participating in competitive calls for projects and human resources.

Our research field covers a wide range of pathology related to ageing, especially linked to fragility: cardiovascular pathology, hip fracture, physical activity, etc. In addition, we have designed interventions to improve the prognosis in hospitalized elderly people (prevention of functional impairment and confusional conditions). Likewise, we have valued the usefulness of ICTs in the care of the elderly. Our most relevant contributions have contributed to modify the clinical practice in such important pathologies as the management of the acute confusional picture or the hip fracture.

Recently we have participated in the design of an Integrated Project of Excellence «Athero-Brain: Heart to Head (H2H) Study», finally funded, in which our group (Dr. Vidán) participates together with the National Center of Cardiovascular Research and the Cardiology Service of the Hospital 12 de Octubre in Madrid.

This solid background has contributed to our group being included as one of the 20 recently created CIBER groups on «fragility and aging» (CIBERFES) that has started in 2017.

7.29. Pharmacology and vascular pathophysiology

Group director: FRANCISCO PÉREZ VIZCAÍNO

Organisms involved: HGUGM - UCM

Type: Consolidated Group

Research lines

- ▶ L1: Pulmonary vascular dysfunction in pulmonary hypertension (PH).
- ▶ L2: Acute respiratory distress syndrome (ARDS).
- ▶ L3: Pulmonary bronchodysplasia (BDP).

Pulmonary hypertension is a condition characterized by an increase in pulmonary vascular resistance whose pathophysiology is complex and not yet well characterized. Our interest is mainly focused on the mechanisms involved in pulmonary vasodilation and in the inhibition of cell proliferation in order to identify and design new drugs that may be potentially useful in the treatment of pulmonary hypertension.

Acute lung damage (ALI) or its most severe form, acute respiratory distress syndrome (ARDS), is characterized by pulmonary edema and alveolar collapse leading to severe arterial hypoxemia. Although protective ventilatory support strategies have improved the prognosis of patients, the associated mortality remains unbearably high. Our interest is to characterize the pulmonary vascular inflammatory response associated with acute lung damage and the identification of therapeutic targets to improve the prognosis in these patients.

Our work focuses on analyzing the pathophysiological and therapeutic role of different signaling pathways in these pathologies: 1) Vitamin D and VDR signaling, 2) K⁺ channels, 3) Endothelial progenitor cells.

NURSING GROUP

Area coordinator:
Ana García Pozo

Nursing Care Research Group

Group directors: ANA GARCÍA POZO

Research lines

Axis 1: Nursing care

- ▶ Line 1: Care for chronically ill patients.
- ▶ Line 2: Care for critically ill patients.
- ▶ Line 3: Physiotherapy and rehabilitation.
- ▶ Line 4: Patient Safety.

Axis 2: Innovation in health care and services

- ▶ Line 1: Development of applications and patents.
- ▶ Line 2: Advanced practice.
- ▶ Line 3: Design and validation of measuring instruments.

Axis 3: Management of human resources

- ▶ Line 1: Professional skills and competence.
- ▶ Line 2: Evaluation and measurement of nursing care time.
- ▶ Line 3: Occupational health and work environment.

Research on the care provided by the nursing group is beginning to generate a large number of major, mainly joint projects. Some of these projects are funded with other nursing groups from other hospitals in the Comunidad de Madrid, the Universidad Complutense de Madrid (UCM), Universidad Rey Juan Carlos (URJC), and Universidad Autónoma de Madrid (UAM). These projects are integrated in the research line of health services and care.

The group is composed of nurses from all professional areas (care, teaching, and management), of whom a large number are lecturers at UCM, URJC and UAM.

Its organizational structure is unique in the Madrid health area, in that it provides support and advice and promotes research in nursing through the Unidad de Apoyo a la Investigación de Enfermería (UAIE [Nursing Research Support Unit]).

The group has a strong certified research training plan for nurses and nursing trainees. Similarly, the group runs a large number of activities to promote research, such as one-day courses, prizes for research, and access to documentary and research resources
